

UPWARDLY-JOINED FLUIDS APPLICATORS and RECEPTACLES Therefor  
Abstract of the Disclosure

Two, or more parallel vertical shafts extend downwardly from a horizontal connecting bridge and which bridge is provided with an upwardly extending, manually wieldable handle.

Shafts' lower portions are provided with selectable applicators for selectable surface applyable fluids, and which applicators are preferably fluids-augmentable taking brush-like and/or dauber-like configurations, and conceivably alternatively taking semi-solid configurations such as for lipsticks and other semi-solid cosmetics.

The parallel shafts, including their selectable applicators, can be downwardly securely, but readily removably upwardly retrievably, inserted through roof-apertures of an uprightable receptacle, and which receptacle might be internally charged with one or more fluid-augmentations for brush-like and/or dauber-like fluids applicators.
